nobody reads mill today wrote a reviewer in time magazine a few years ago one could scarcely praise mr melvin maddocks who penned that remark for his awareness of the present state of mill studies for of all nineteenth century philosophers who wrote in english it is 1 s mill who remains the most read today yet it would not be so far from the truth to say that very few people pay much serious attention nowadays to mill s writings about logic and metaphysics as distinct from those on ethical and social issues despite the fact that mill put enormous effort into their composition and through them exerted a considerable influence on the course of european philosophy for the rest of his century but the only sections of a system of logic 1843 and an examination of sir william hamilton s philosophy 1865 to which much reference is now made comprise only a small proportion of those very large books and the prevailing assumption is that mill s theories about logical and meta physical questions are with few exceptions of merely antiquarian interest bertrand russell once said that mill s misfortune was to be born at the wrong time russell 1951 p 2 it can certainly appear that mill chose an inauspicious time to attempt a major work on logic

a collection of essays from distinguished contributors looking at why it is that mathematical proof is given precedence over other forms of mathematical justification

originally published in 1978 the main task of this book was to consider the psychology of thinking in relation to the various perspectives from which thought processes were studied at the time it provided an up to date and critical evaluation of current experimental studies of thinking organized within a framework which reflects the separate theoretical orientations and methodologies through which these investigations are carried out this approach will help the reader to become aware of the complex relationship between the theoretical orientations the problems selected for investigation and the methods used for studying them an important underlying theme of the book concerns the relationship between the activities of the thinker and the demands of his environment as far as is known this was the only textbook on thinking to deal with the subject matter specifically in terms of theoretical approaches and methods of investigation at the time

this series of books presents the fundamentals of logic in a style accessible to both students and scholars the text of each essay presents a story the main line of development of the ideas while the notes and appendices place the research within a larger scholarly context the basic theme here is the analysis of formal logic in terms of what metaphysical assumptions we need when we develop the formal systems we use the essays together give a perspective of formal logic as part of the art of reasoning well the essays are possibilities and valid inferences a general framework for semantics for propositional logics why are there so many logics truth and reasoning on translations reflections on temporal and modal logic the timelessness of classical predicate logic events in the metaphysics of predicate logic categoricity with minimal metaphysics reflections on gödel s theorems on the error in frege s proof that names denote and postscript logic as the art of reasoning well

a presentation of current work that systematically explores and articulates the nature origin and development of reasoning this volume s primary aim is to describe and examine contemporary theory and research findings on the topic of deductive reasoning many contributors believe concepts such as structure competence and mental logic are necessary

features for a complete understanding of reasoning as the book emanates from a Jean Piaget symposium his theory of intellectual development as the standard contemporary treatment of deductive reasoning is used as the context in which the contributors elaborate on their own perceptions

this undergraduate textbook reviews psychological research in the major areas of reasoning and thinking deduction induction hypothesis testing probability judgement and decision making it also covers the major theoretical debates in each area and devotes a chapter to one of the liveliest issues in the field the question of human rationality central themes that recur throughout the book include not only rationality but also the relation between normative theories such as logic probability theory and decision theory and human performance both in experiments and in the world outside the laboratory no prior acquaintance with formal systems is assumed and everyday examples are used throughout to illustrate technical and theoretical points the book differs from others in the market firstly in the range of material covered other tend to focus primarily on either reasoning or thinking it is also the first student level text to survey an important new theoretical perspective the information gain or rational analysis approach and to review the rationality debate from the standpoint of psychological research in a wide range of areas

science is not a collection of facts science is the process by which we draw inferences from facts volume i of logic and critical thinking in the biomedical sciences invites readers to linger over a collection of common observations to see what inferences can be drawn when one applies a bit of deductive logic if we just think about what we observe it is often possible to discover profound biomedical insights volumes 1 and 2 of logic and critical thinking in the biomedical sciences are written for biomedical scientists and college level students engaged in any of the life sciences including bioinformatics and related data sciences provides a strong introduction to deductive methods that can be directly applied to the biomedical sciences using hundreds of examples shows how creative scientists draw important inferences from observations that are often ignored by their peers discusses complex biological and medical concepts in a relaxed manner intended to focus the reader's attention on the

deductive process without dwelling excessively on details

this book addresses an apparent paradox in the psychology of thinking on the one hand human beings are a highly successful species on the other intelligent adults are known to exhibit numerous errors and biases in laboratory studies of reasoning and decision making there has been much debate among both philosophers and psychologists about the implications of such studies for human rationality the authors argue that this debate is marked by a confusion between two distinct notions a personal rationality rationality¹ evans and over argue that people have a high degree of rationality¹ but only a limited capacity for rationality² the book re interprets the psychological literature on reasoning and decision making showing that many normative errors by abstract standards reflect the operation of processes that would normally help to achieve ordinary goals topics discussed include relevance effects in reasoning and decision making the influence of prior beliefs on thinking and the argument that apparently non logical reasoning can reflect efficient decision making the authors also discuss the problem of deductive competence whether people have it and what mechanism can account for it as the book progresses increasing emphasis is given to the authors dual process theory of thinking in which a distinction between tacit and explicit cognitive systems is developed it is argued that much of human capacity for rationality¹ is invested in tacit cognitive processes which reflect both innate mechanisms and biologically constrained learning however the authors go on to argue that human beings also possess an explicit thinking system which underlies their unique if limited capacity to be rational
